ABSTRACT

The online movie ticket booking system is a web-based application designed to facilitate the process of reserving tickets for movies in theaters. This system aims to enhance user convenience by allowing moviegoers to browse movie listings, select preferred showtimes, and purchase tickets from the comfort of their homes or while on the go. The system provides a user-friendly interface with features such as real-time seat selection, secure payment gateways, and instant confirmation of bookings. Additionally, it offers theaters an efficient way to manage ticket sales, track bookings, and reduce administrative overhead. By integrating features like promotional offers, user reviews, and movie trailers, the system also aims to enrich the user experience and drive engagement. This abstract outlines the key functionalities and benefits of the online movie ticket booking system, emphasizing its role in modernizing the ticket purchasing process and improving overall customer satisfaction.

1.INTRODUCTION

1.1 INTRODUCTION

The online movie ticket booking system is designed to make it easy for users to book movie tickets from their computers or mobile devices. It allows users to browse movie listings, view showtimes, select seats, and make secure payments. The system sends email and SMS notifications for booking confirmations and reminders. It also provides theater administrators with tools to manage movie schedules and seat availability. This project aims to enhance the convenience and efficiency of booking movie tickets.

1.2 OBJECTIVES

The objective of the online movie ticket booking system project is to develop a user-friendly platform that enables users to effortlessly browse movie listings, select seats, and purchase tickets online. The system aims to provide a seamless and secure booking experience, enhance user convenience by eliminating the need for physical queues, and offer robust management tools for theater administrators to efficiently handle movie schedules and seat availability. By achieving these goals, the project seeks to improve the overall movie-going experience for users and streamline operations for theaters.

1.3 MODULES

1. User Management

- **Registration Module:** Allows new users to create accounts using email, phone number, or social media.
- **Login/Authentication Module:** Manages user login, authentication, and password recovery.
- **Profile Management Module:** Enables users to view and update their personal information.

2. Movie Browsing

- **Movie Listings Module:** Displays currently showing and upcoming movies with detailed information (synopsis, cast, duration).
- **Search and Filter Module:** Allows users to search for movies by title, genre, date, and other criteria.

3. Seat Selection

- **Seating Layout Module:** Shows the seating chart for each theater.
- **Seat Availability Module:** Provides real-time updates on seat availability.
- **Seat Reservation Module:** Allows users to select and reserve seats.

4. Booking and Payment

- **Ticket Booking Module:** Manages the process of booking tickets and generates booking IDs.

- Payment Gateway Integration Module: Integrates with third-party payment systems (e.g., PayPal, Stripe) to handle transactions.
- Confirmation and Notification Module: Sends booking confirmations and reminders via email and SMS.

5. Theater Management (Admin Panel)

- Movie Management Module: Allows admins to add, update, and delete movie listings.
- Schedule Management Module: Enables admins to manage movie showtimes and schedules.
- Seat Management Module: Provides tools for managing seat availability and layout configurations.

6. Reporting and Analytics

- Booking Reports Module: Generates reports on ticket sales, revenue, and booking trends.
- User Activity Reports Module: Tracks user activity and engagement metrics.

7. Security and Compliance

- User Data Security Module: Ensures encryption and protection of user data.
- Payment Security Module: Complies with PCI-DSS standards for secure payment processing.

8. System Administration

- Backup and Recovery Module: Manages regular data backups and recovery processes.
- Performance Monitoring Module: Monitors system performance and uptime.
- Logging and Troubleshooting Module: Maintains detailed logs for troubleshooting and maintenance purposes.

3.TECHNOLOGIES USED:

3.1 LANGUAGES USED

1.PYTHON

Python is commonly used for web development, data analysis, artificial intelligence, and automation.

2.MY SQL

MySQL is frequently used as a relational database management system (RDBMS) for storing and managing structured data in various applications, including web development, enterprise software, and data-driven applications.

3.TINKER

Tkinter is utilized in Python for creating graphical user interfaces (GUIs) through its built-in library, facilitating the development of interactive desktop applications.

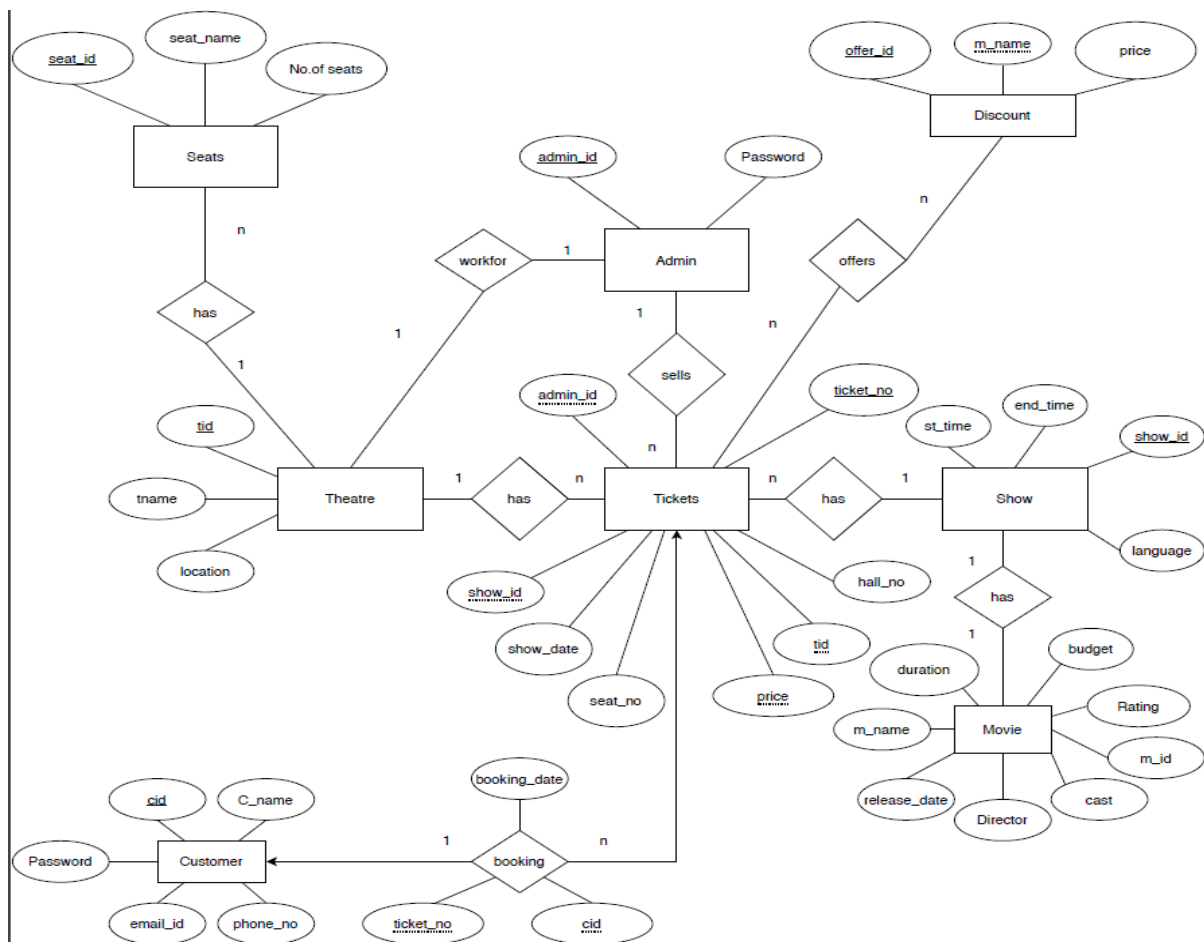

3.2 TOOLS USED

PYCHARM

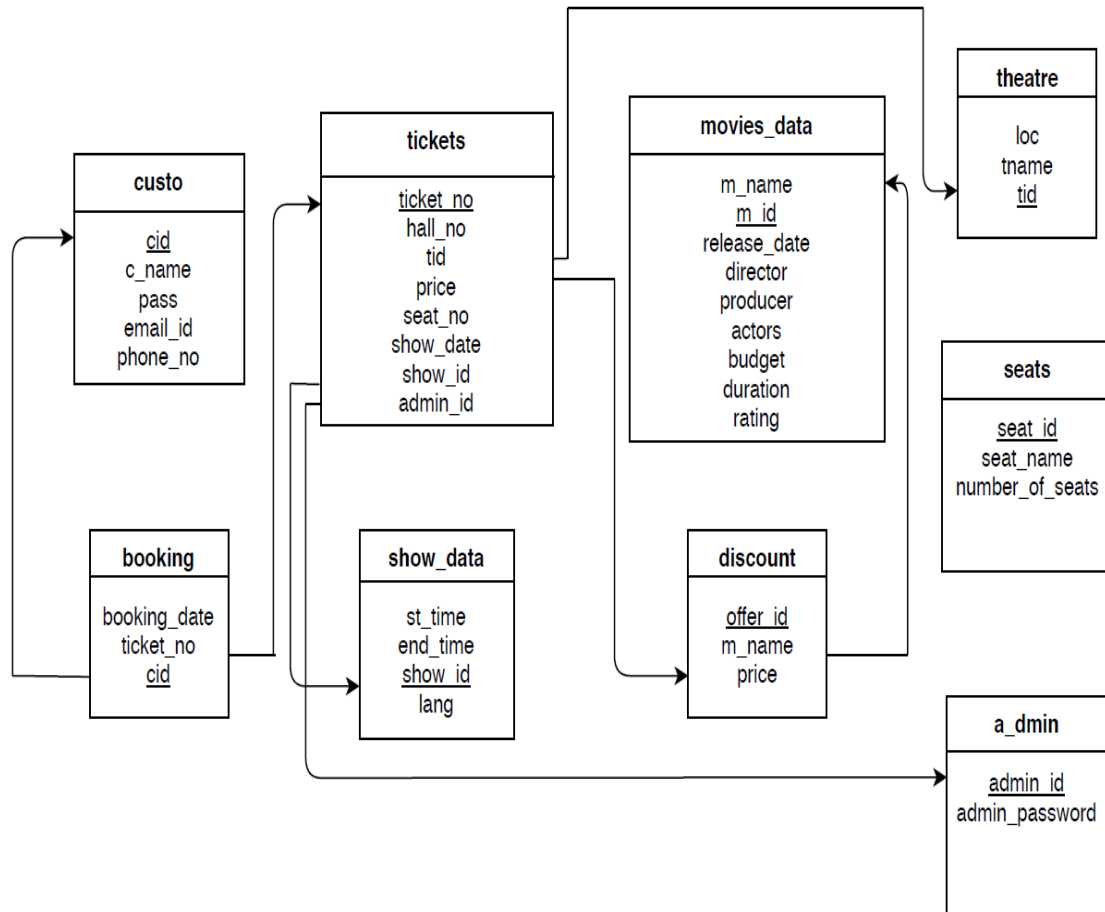

PyCharm is an integrated development environment (IDE) designed for Python programming, offering features such as code editing, debugging, and project management, thereby enhancing developer productivity and facilitating efficient Python application development.

```

5.RESULT

"Create 6 Columns"
'username', 'password', 'city',
'Moviename', 'seatname', 'Amount'.

In the Sign Up and Login window, ensure usernames and password are at least 6 characters long. If less than 6 characters are entered, display an error message, which disappears after 3 seconds.

Username and Password must be at least 6 characters long

I added a "Show Password" option in the Sign Up and Login window for toggling password visibility.

Now, the user selects their preferred movie.

After selecting a movie, the seat selection window opens, and I added logout and back buttons in label.

After city selection, the label switches to "Your City", and the menu button relocates to the top-left side of the label.

For city changes after selection, I display the preview as shown.

In the login window, entering incorrect username and password displays an error.

All data, Including username, password, city, Movie name, seat name and total amount is stored in the SQL database.

The screenshot displays the phpMyAdmin web interface. On the left sidebar, the database structure is shown with 'logindetails' selected, and 'userdatas' highlighted. The main panel shows the 'Browse' tab for the 'userdatas' table. A red box highlights the 'Browse' tab in the top navigation bar. Another red box highlights the table's data, which includes columns: username, password, city, Moviename, seatname, and Amount. The data row shows: starboy, 12345678, Your City: Chennai, Movie 1, C6,C7,C8,C9, 760. The interface also shows a SQL query editor with the query 'SELECT * FROM `userdatas`' and various options for displaying and exporting the data.

username	password	city	Moviename	seatname	Amount
starboy	12345678	Your City: Chennai	Movie 1	C6,C7,C8,C9	760

7.CONCLUSION

In conclusion, the development of an online movie ticket booking system offers significant benefits to both users and theater administrators. By providing a user-friendly platform for booking movie tickets from any location, the system enhances convenience and eliminates the need for physical queues. Additionally, robust management tools empower theater administrators to efficiently manage movie schedules and seat availability, while features such as real-time updates, secure payment processing, and notification systems enhance the overall user experience. With its focus on usability, security, and reliability, the online movie ticket booking system project aims to streamline operations, improve customer satisfaction, and contribute to the modernization of the movie-going experience.
